

One may always have differences of opinion about specific items, and no author should be criticized simply because the reviewer doesn't agree with him. For example, using water-alcohol mixtures for cooling is a procedure long since abandoned by us, since water alone, properly used, is just as effective and far less dangerous. Also, the term "respirator lung" in itself has no real meaning. On the basis of present-day understanding of what goes on in the lungs of patients on respirators, this reviewer also takes issue with the use of heated nebulizers, which he considers both dangerous and unnecessary. The section on nebulization leaves much to be desired.

In summary, this is an excellent text for the expert familiar with the field, and may be useful for persons at the resident level. It would appear to be of limited usefulness for others, such as nurses, physician assistants, or technicians.

Books Reviewed

From time to time we shall publish a list of books received. A number but not all of these volumes will subsequently be reviewed. It is hoped that this listing will serve as a reference source for anesthesia and related literature.—M.H.H.
